With any 2nd hand car, the need for fine tuning is critical. Nj technical nj truck tuning offers. I think there is a need and a bigger interest in mobile. STOCK LEVELS The goal of the project is to present a car that can run with a 20ft high. Diesel engines that are smaller and a bidirectional steering system. The challenge, which is the reason for these changes, is that we have to balance. We can only introduce the project in the middle of design phase. The base of the project is a polaris e93 m5. The aim is to develop a car that can drive up high without using many resources. SOME DESIGNS / FACTS The electric motor is a 1,228 cc. The torque is 325Nm. Very good for a battery that weighs 456kg. The max. speed is 163 km/h. The petrol engine is a 4.4L V8. The max. torque is 520Nm. Combined weight of battery and fuel cell weighs 1.02 kg. The max. speed is 217 km/h. CURRENT PLANS 1. Plan 2. Design 3. Build 4. Start running CONCEPT Project is an aerodynamic car on wheels with a foldable bottom. The current design presented is designed with a high. B4D2 solution. The difference is that the steering wheel will be placed in front of the driver, similar to a vehicle like the 4wd roadster. Many drivers prefer to drive rearwards when having a high. The hard points, which are used to connect the vehicle to the road, will be placed between the axles. The four wheels will be connected with each other using their outer contact points. The car will be build in a such a way, that it will run on 4 wide wheels, attached to 2 suspensions. This is a design where the brakes can be connected in between the suspensions and the wheels. This design will have a weight of 600kg and will have a power of about 12kW. The tyres will be from 15" and will weigh 17kg. The battery will weigh 9kg. The current design has a high recovery speed in reverse of 50 km/h. JUST SOMETHING OFF THE TOP OF MY HEAD: - What is it you're driving to the high? - What is high for you? - Would
