DESCRIPTION: Batgirl comes out of retirement to avenge the death of her mentor, Barbara Gordon, only to find that the crime-ridden city of Gotham is in even worse danger than.The invention relates to the field of speech recognition and speech signal processing, and more particularly to a system and method for efficient large vocabulary text recognition in speech recognition systems. In many text/speech recognition applications, the statistical properties of a speech utterance are modeled in a Hidden Markov Model (HMM) framework. Speech recognition systems typically use a vocabulary database to build a model of the statistical properties of utterances in the vocabulary. A problem faced by many prior art speech recognition systems is the very large amount of memory required to store such a vocabulary database. There is a trend in speech recognition technology toward the development of systems capable of recognizing large vocabularies. For example, one common voice command scheme is to recognize from thousands to millions of voice commands from a user. A further problem faced by these systems is the time required for the processing of a voice command. The processing of such large vocabularies requires large amounts of memory and processing power that rapidly becomes expensive. Although there are many prior art systems and methods for recognizing and processing large vocabularies, these systems suffer from several drawbacks. Typically, these methods are inefficient and fail to take advantage of the statistical information available in speech. The present invention provides a system and method that enable efficient large vocabulary text recognition in speech recognition systems. The present invention provides for efficient storage of a vocabulary database. The present invention allows for the efficient processing of a voice command using reduced amounts of memory and processing power. The present invention also provides for a natural spoken utterance to be represented using a reduced number of symbols.Post-intervention period among young children aged 6 to 10 years in North Carolina, 2004 and 2007.
